

Glyphosate then Spray.Seed

Rates quoted in HerbiGuide are for the total amount of herbicide applied.

Apply half of this rate as glyphosate 450g/L and then 3-10 days later apply the other half as Spray.Seed.

For example: A rate of 1000 mL/ha would be applied as 500 mL/ha of glyphosate followed by 500 mL/ha Spray.Seed 3-10 days later.

This technique provides control of a wide range of weeds. Clovers and older Mallows are the plants most likely to survive. If both of these are present add 100 mL/ha of Goal to the Spray Seed or 50 mL/ha of Hammer to the glyphosate.

See the individual components for further information.
